Chapter 5

DETERMINING AVERAGES: MEAN AND MEDIAN

To calculate the mean, add all of the values and divide by the number of items. To figure out the average cost of a bicycle in a local bike shop, for example, you would add the cost of all the bicycles and then divide by the total number of bikes in the shop. Another useful statistic is the median. The median represents the midpoint of a sample. For example, if the median price of bicycles is \$200, half of the bikes are more than \$200 and half are less.

Directions: Examine the data presented in the table below and answer the questions that follow.

Employee	Hourly Wage	Weekly Hours Worked
Brian Donnelly	\$6.95	12
Ron Nguyen	\$6.95	18
Robert Lee	\$7.25	30
Michele Lewis	\$7.45	22
Shanlqua Thompson	\$7.05	25

1. What is the average hourly wage? How did you calculate it?

2. What was the average number of hours worked by the five employees? How did you calculate it?

3. What was the median wage? How did you calculate it?

4. What was the median number of hours worked? How did you calculate it?
